

"METHOD FOR SEALING CAPSULES AND APPARATUS TO PERFORM SAID SEALING"

ABSTRACT

The capsules are disposed on a first rigid support (A1) movable in steps provided  
5 with a first plurality of seats (B1) designed to each contain a respective capsule  
(7), the support (A1) being designed to feed the capsules to means (5) designed to  
distribute a sealing solution along the rim of the cap (7B) of each capsule. The  
capsules (7) that have received the solution are then transferred from said first  
rigid support (A1) to a second rigid support (A3) movable in steps provided with a  
10 second plurality of seats (B3) designed to contain a respective capsule (7), the  
second rigid support (A3) then in turn transferring the capsules (7) to an unloading  
station (8) after a time sufficient to consolidate sealing.
